

# CS2302 - Data Structures

Spring 2020

## Lab 4

Due Monday, March 23, 2020

A binary search tree can be implemented as a list of lists  $T$  as follows:

- If the tree is empty,  $T = \text{None}$
- Otherwise  $T = [\text{data}, \text{left}, \text{right}]$ , where  $\text{data}$  is the item stored in the root node and  $\text{left}$  and  $\text{right}$  are the (possibly empty) left and right subtrees of  $T$ , represented in the same way as  $T$ .

Thus if  $T$  represents a non-empty binary search tree,  $T[0]$  is the item stored in the root node of the tree,  $T[1]$  is the left subtree, and  $T[2]$  is the right subtree. Figures 1 to 4 show example binary search trees and their corresponding list representations. Notice that if  $T$  is not empty,  $\text{len}(T)=3$ .

For this lab, you will implement some of the functionality of binary search trees using a list implementation. Your task consists of implementing the following to be added to the provided *bst\_list* program:

1.  $\text{size}(T)$  - Returns the number of data items in the tree.
2.  $\text{minimum}(T)$  - Returns the smallest item stored in the tree.
3.  $\text{maximum}(T)$  - Returns the largest item stored in the tree.
4.  $\text{height}(T)$  - Returns the height of the tree. Recall that the height is depth of the deepest leaf in the tree. For example, the trees in figures 1 to 4 have heights of 1, 2, 3, and 3.
5.  $\text{inTree}(T,i)$  - Boolean function, returns *True* if item  $i$  is in the tree and *False* otherwise.
6.  $\text{printByLevel}(T)$  - Prints the data items in the tree ordered by depth.
7.  $\text{tree2List}(T)$  - Returns a sorted list containing all the items in the tree (this must run in  $O(n)$  time).
8.  $\text{leaves}(T)$  - Returns a list of the items in the tree that are stored in leaf nodes.
9.  $\text{itemsAtDepthD}(T,d)$  - Returns a list of the items that are stored at depth  $d$  in the tree.
10.  $\text{depthOfK}(T,k)$  - Returns the depth of the node that contains  $k$ , or -1 if  $k$  is not in the tree.
11.  $\text{draw}(T)$  - Draws the tree.

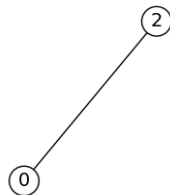

Figure 1:  $T=[2, [0, \text{None}, \text{None}], \text{None}]$

As usual, write a report describing your work. Show results of every function with various types of inputs, including an empty tree, a tree with a single node, and balanced and unbalanced trees of different sizes. For every function, write its running time as a comment in the code.

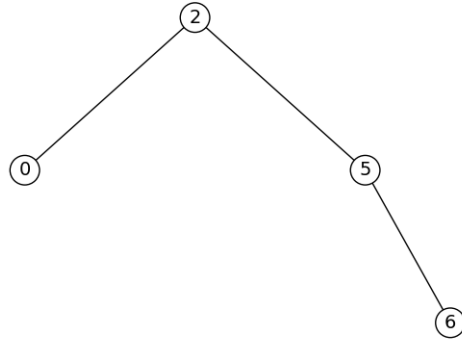

Figure 2:  $T=[2, [0, \text{None}, \text{None}], [5, \text{None}, [6, \text{None}, \text{None}]]]$

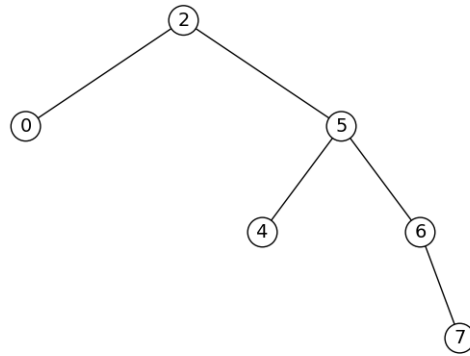

Figure 3:  $T=[2, [0, \text{None}, \text{None}], [5, [4, \text{None}, \text{None}], [6, \text{None}, [7, \text{None}, \text{None}]]]$

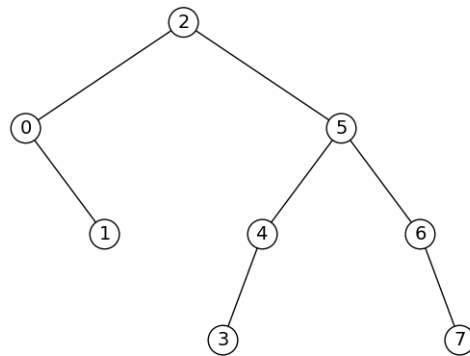

Figure 4:  $T=[2, [0, \text{None}, [1, \text{None}, \text{None}]], [5, [4, [3, \text{None}, \text{None}], \text{None}], [6, \text{None}, [7, \text{None}, \text{None}]]]$
